We have developed a set of concepts for modelling business systems. The set has been implemented as a modelling tool called (CuTiDe) Customized Design Thinking. CuTiDe is used experimentally to evaluate whether it can be used as a communication tool to assist understanding of complex systems.

We are developing a resilience framework to help business decision makers to highlight areas where resilience is lacking. Visualizing business models in a way that is readable by business users is challenging. Using CuTiDe modelling tool developed in coordination with University of Vienna, we managed to develop a business concept model that is readable by business community for discussions on improving resilience.
